“I’m taking allopurinol, but I’m not getting relief”

Are you taking allopurinol but still having gout attacks? Is your serum uric acid level still too high? Would you like to learn more about managing your gout?

Our doctors are looking for men and women aged 18 to 85 with gout to take part in a clinical research study for people who are taking allopurinol but still have had two or more gout attacks in the past year. This study is evaluating an investigational drug to see, when combined with allopurinol, if it works better in reducing high uric acid levels in the blood—the chemical in the body that causes gout attacks.

Here’s some information to help you decide if you would like to learn more about this study.

What would my study participation involve?

• Attend study appointments for up to 14 months. Most visits will be monthly.
• Follow study instructions by the study doctor and staff.
• Have tests done to check your health.
• Keep track of your medications, gout attacks, and how you are feeling.

What will I receive as a study participant?

• Daily investigational medication at no cost.
• Study-provided allopurinol at no cost.
• Close monitoring of your gout through study-related medical care at no cost.
• You may also be provided compensation to cover your time and travel expenses.

Don’t wait for another gout attack to strike. Now is the time to act.
